EXPERIENCE

Full Stack Software Engineer

Oct. 2024 – Present

Infocus Healthcare, LLC

- Led the integration of a third-party vendor's screening system to our coaching platform via SFTP so results attach to the member automatically, eliminating 10 hrs/week coaches spent manually matching screening results to clients
- Integrated Auth0 SSO across an Angular/TypeScript SPA and multiple Rails services using OIDC and OAuth2 silent authentication, eliminating redundant logins for 60K+ users during platform migration
- Designed a Rails automated messaging system that halts on certain rules, backed by a database constraint preventing duplicates, delivering 600+ messages/week and returning 15+ hrs/week to client work
- Owned the REST integration between our coaching platform and a partner member portal, building the chat API and user sync that gave coaches a single messaging channel and eliminated duplicate account creation
- Improved app reliability and performance using automated smoke tests, SQL query optimization, and proper DB-indexing reducing page load times by 50% for a Rails monolith managing 120K+ client case records

Full Stack Software Engineer

Mar. 2025 – Nov. 2025

Freelance

- Created a speech therapy app using Ruby on Rails and OpenAI Whisper API, automating transcription and feedback for 20+ apraxia patients while achieving zero PII collection through pseudonymous authentication
- Shipped an admin dashboard for progress tracking and usage reporting, cutting manual data compilation for apraxia research by 80% and letting clinicians pull their own reports without engineering involvement

Software Engineer Fellow

Aug. 2024 – Sept. 2024

Headstarter AI

- Launched an AI-powered flashcard SaaS on Next.js and the OpenAI API, generating personalized study materials from user-supplied topics for 200+ active users and 1,000+ generations within the first two months

PROJECTS

TrackExp | *Personal Project*

Jan. 2025 – Nov. 2025

- Built a personal expense tracker in Rails deployed on a DigitalOcean VPS, with category analytics and automated recurring-bill tracking that surfaced \$300+ in overlooked subscription costs

ChatPDF | *Personal Project*

Sept. 2024 – Oct. 2024

- Built a RAG chat application over uploaded PDFs with Next.js, Convex, and LangChain, scoping every retrieval to the chat's own file through a metadata filter so answers can never be drawn from another document
- Chunked documents at 500 characters with 50-character overlap into a vector store backed by cached embeddings to avoid re-embedding repeat content, and prompted for explicit abstention when an answer isn't in the source

HACKATHONS & ACHIEVEMENTS

Hiring Hackathon for Rilla | *Finalist — 200+ Teams — 36 Hour Hackathon*

Aug. 2024 – Sept. 2024

- Created AI annotation tool using Next.js and GPT-4 that parsed sales call transcripts to highlight objections, commitments, and coaching opportunities, compressing 45-minute call reviews into 5-minute insights for managers
- Wired the annotation UI into the LLM loop, feeding manager-highlighted transcript spans back into the prompt so reviewers could steer the analysis toward what mattered instead of re-running a full transcript pass

EDUCATION

Binghamton University, State University of New York

Binghamton, NY

Bachelor of Arts in Mathematical Sciences

Aug. 2020 – May 2024

TECHNICAL SKILLS

Programming Languages: Ruby, JavaScript, Python, TypeScript, R

Frameworks/Libraries: Ruby on Rails, React, Next.js, Convex, Docker,RSpec

Technologies: AWS, Auth0, LaunchDarkly, Langchain, Firebase, Postman, Git, Linux

Interests: Pickleball, bouldering, gaming, personal finance, olympic weightlifting, hiking
